

Our Solar System

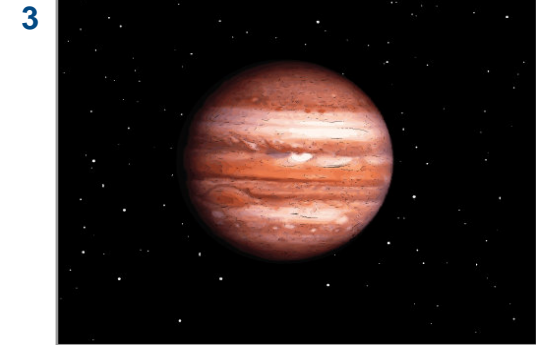

Created by Melissa Nelson on Dec 1, 2009

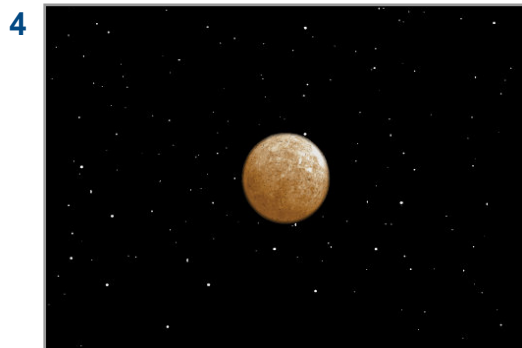

Today lets learn about our solar system.

The eight planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Earth is the third planet from the sun.

The fifth planet from the sun is Jupiter. It is the largest planet with twice as much mass as all the other planets put together. Jupiter also has the Great Red Spot.

Pluto used to be considered the ninth planet in our Solar System but was reclassified as a dwarf planet in 2006.

That is an introduction to our Solar System. I hope you will go out and learn more about all the amazing planets.
